### **Abstract:**

Integrating information and communication technologies ( IT&C) in teaching, learning and assessment in the last two decades has become a priority of educational policies all over the world as it opens new horizons for education practice: facilitating the processes of presenting information, of processing them by the student, of knowledge building.

The aim of the present study is to show that the technology can help students better understand mathematical concepts and may improve the performance and skills to solve different problems. Using ICT tools with traditional methods of teaching / learning leads to increasing the effectiveness of teaching, and also in teaching/ learning mathematics.
